

Regulations for the Production and Distribution of Nursery Stock

The following regulations are promulgated establishing standards to maintain the health and vigor of nursery stock offered, or to be offered, for sale when stored and displayed at retail outlets:

(a) Storage and display conditions:

(1) Balled and burlapped nursery stock shall be maintained by surrounding and covering the earth ball with sawdust, peat, vermiculite, shingletow or other material not toxic to plants. Such moisture holding material shall be kept moist at all times.

(2) Container grown nursery stock shall be watered sufficiently to maintain the viability and vigor of such stock and shall be kept under temperature and light intensity conditions that will permit normal growth.

(3) Bare-root nursery stock shall be kept under conditions of temperature and moisture and retard growth and maintain viability. Moisture must be supplied to the root system by high humidity conditions in storage or by covering the roots with soil, or other moisture-holding material not toxic to plants; such moisture-holding material to be kept moist at all times.

(4) Prepackaged nursery stock with roots packaged in moisture retaining plastic, peat, shingletow or other moisture retaining material must be stored and displayed under conditions that will retard etiolated (non-green) or otherwise abnormal growth and will insure an adequate supply of moisture to the roots at all times.

(b) Nursery stock which by reason of desiccation, damage or other cause will not grow normally, shall be removed from sale by the owner or person in charge of such stock.
